Government-Owned Inventions; Availability for Licensing

AGENCY: National Institutes of Health, HHS.

ACTION: Notice.

SUMMARY: The invention listed below is owned by an agency of the U.S. Government and is available for licensing to achieve expeditious commercialization of results of federally-funded research and development. Foreign patent applications are filed on selected inventions to extend market coverage for companies and may also be available for licensing.

FOR FURTHER INFORMATION CONTACT: Licensing information and copies of the patent applications listed below may be obtained by communicating with the indicated licensing contact at the Technology Transfer and Intellectual Property Office, National Institute of Allergy and Infectious Diseases, 5601

Fishers Lane, Rockville, MD, 20852; tel. 301-496-2644. A signed Confidential Disclosure Agreement will be required to receive copies of unpublished patent applications.

SUPPLEMENTARY INFORMATION: Technology description follows.

Small Molecule Imaging of Fungi by Positron Emission Tomography Scanning

Description of Technology

This technology relates to the field of radioactive, isotopically-labeled calcofluor derivatives and uses of such compounds to detect a broad spectrum of filamentous fungi including pathogenic species such as *Aspergillus* and *Mucorales*, by diagnostic imaging methods such as positron emission tomography (PET) scanning.

Aspergillosis and other filamentous fungal infections are increasingly common fungal lung infection with high mortality rates (over 50%) in immune compromised patients, such as those receiving chemotherapy, stem cell/organ transplantation, or HIV patients. One-year survival of the infected patients ranges from 59% (organ transplant recipients) to as low as 25% (stem cell transplant recipients). Delayed diagnosis and therapy are likely to lead to poor outcomes and death. This disease is often first detected as nodules on CT scans. A diagnosis is typically made following invasive lung bronchoscopy or biopsy. However, as these patients are immunocompromised, these invasive procedures may themselves lead to significant complications and infections. Therefore, to enable timely treatment and minimize complications, there is a critical need for non-invasive means to detect and diagnose fungal infections.

The calcofluor derivatives disclosed in the patent application may be utilized as imaging agents specific for fungal infections and could potentially become a standard, non-invasive procedure in the work-up of immunocompromised patients with lung infections.

This technology is available for licensing for commercial development in accordance with 35 U.S.C. 209 and 37 CFR part 404, as well as for further development and evaluation under a research collaboration.

Potential Commercial Applications

- Diagnostics of Aspergillosis and other filamentous fungal infections.

Competitive Advantages

- Non-invasive.
