

method was developed for detecting and measuring residues of bifenazate in or on raw agricultural commodities. The method utilizes reverse phase high pressure liquid chromatography (HPLC) to separate bifenazate from matrix derived interferences, and oxidative coulometric electrochemical detection (OCED) for the identification and quantification of this analyte. Using this method, the limit of quantitation (LOQ) for bifenazate in stone and pome fruit, grapes, strawberries and cotton was 0.01 ppm. For hops, the LOQ was 0.05 ppm. The limit of detection for this method, which varies with matrix, is 0.005 ppm. The analytical method for bifenazate and its major metabolite, D3598, in animal samples was designed using the same principles invoked in the plant method with minor modifications. However, in animal samples, a separate aliquot of the extract was used to determine residues of A1530 and its sulfate (combined) in milk and meat samples (these metabolites appeared to be significant in goat metabolism studies). The extract was subjected to acid hydrolysis to convert the sulfate conjugate to A1530 before it was quantified by HPLC using fluorescence or OCED detectors.
