

and intermediate dermal toxicity studies with rats, EPA has determined that an added FQPA safety factor of 3x is appropriate of assessing the risk of glufosinate-ammonium derived residues in crop commodities.

Using the conservative assumptions described in the exposure section above, the percent of the chronic RfD that will be used for exposure to residues of glufosinate-ammonium in food for children 1–6 (the most highly exposed sub-group) is 61%. Infants utilize 37% of the chronic RfD. As in the adult situation, drinking water levels of comparison are higher than the worst case DWECs and are expected to use well below 100% of the RfD, if they occur at all.

Therefore, there is a reasonable certainty that no harm will occur to infants and children from aggregate exposure to residues of glufosinate-ammonium.

F. International Tolerances

Maximum residue limits (Codex MRLs) for glufosinate-ammonium and metabolites in or on rice commodities have not been established by the Codex Alimentarius Commission.
