

mixer/loader/applicator using the same equipment were 14,900 and 1,070 ppm, respectively. Short-term and intermediate-term margins of post-application exposure for adults ranged from 408 - 2,120. The margins-of exposure for youth ranged from 712 to 3,700. Chronic margins of post-application exposure exceeded 4,930 for adults and youth.

For the remaining uses (wood treatment, plastics, paints, glues and adhesives) EPA has determined that exposure via incidental ingestion (by children) and inhalation is not a concern for these products which are used outdoors. A non-dietary assessment of exposure to tebuconazole from the copper tebuconazole-treated wood showed all tebuconazole MOEs exceeding 10,000. Therefore, there is no unacceptable risk associated with this use for tebuconazole.

D. Cumulative Effects

Tebuconazole is a member of the triazole class of systemic fungicides. At this time, the EPA has not made a determination that tebuconazole and other substances that may have a common mechanism of toxicity would have cumulative effects. Therefore, for this tolerance petition, it is assumed that tebuconazole does not have a common mechanism of toxicity with other substances and only the potential risks of tebuconazole in its aggregate exposure are considered. The cumulative effects of the primary common metabolites (1,2,4-triazole and its TA and TAA conjugates are being addressed by the US Triazole Task Force.

E. Safety Determination

1. *U.S. population.* Based on the exposure assessments described in C under aggregate exposure and on the completeness and reliability of the toxicity data, it can be concluded that aggregate exposure estimates from all label and pending uses of tebuconazole are 17.5% of the aPAD and 0.1% percent of the cPAD for dietary exposures. Exposure estimates calculated from tebuconazole in drinking water are below the EPA's level on concern. In addition, no unacceptable risks were determined for non-dietary exposure.

2. *Infants and children.* In assessing the potential for additional sensitivity of infants and children to residues of tebuconazole, data from developmental toxicity studies in mice, rats, rabbits and a 2-generation reproduction study in the rat are considered. The developmental toxicity studies are designed to evaluate adverse effects on

the developing organism resulting from maternal pesticide exposure during gestation. Reproduction studies provide information relating to effects from exposure to the pesticide on the reproductive capability of mating animals and data on systemic toxicity.

Using the conservative exposure assumptions described above under Aggregate Exposure, it can be concluded that the aggregate dietary exposure estimates from the proposed uses of tebuconazole would not exceed 27.6% of the aPAD and 0.3% of the cPAD for the most sensitive population subgroup children (1–2 years). Exposure estimates calculated from tebuconazole in drinking water are below the EPA's level on concern. In addition, no unacceptable risks were determined for non-dietary exposure.

F. International Tolerances

For tebuconazole uses pending with the EPA, CODEX MRLs have been established for barley at 0.2 mg/kg; barley straw and fodder, dry at 10 mg/kg; cucumber at 0.2 mg/kg; pome fruits at 0.5 mg/kg; summer squash at 0.02 mg/kg; wheat at 0.05 mg/kg and wheat straw and fodder, dry at 10 mg/kg.
