

2. *Non-dietary exposure.* Clomazone is only registered for use on food crops. Since the proposed use on mint is consistent with existing registrations, there will be no non-dietary, non-occupational exposure.

D. Cumulative Effects

Clomazone is an isoxazolidinone herbicide. No other registered chemical exists in this class of chemistry. Therefore, given clomazone's unique chemistry low acute toxicity, the absence of genotoxic, carcinogenic, developmental or reproductive effects, and low exposure potential, the expression of cumulative human health effects with clomazone and other natural or synthetic pesticides is not anticipated.

E. Safety Determination

1. *U.S. population.* Using TMRC (a conservative exposure assumption), and based on the completeness and reliability of the toxicology data, it is concluded that aggregate exposure due to existing registered uses, and pending uses of clomazone will utilize less than 1% of the RfD for the U.S. population. Additionally, an analysis concluded that aggregate exposure to clomazone adding mint (spearmint tops and peppermint tops) at 0.05 ppm tolerance level will utilize a negligible percent of the RfD for the U.S. population. EPA generally has no concern for exposures below 100% of the RfD because the RfD represents the level at or below which daily aggregate dietary exposure over a lifetime will not pose appreciable risks to human health. Therefore, it is concluded that there is a reasonable certainty that no harm will result from aggregate exposure to residues of clomazone, including all anticipated dietary exposure.

2. *Infants and children—* Safety factor. Based on the current toxicological data requirements, the data base relative to prenatal and postnatal effects for children is complete. Further, for clomazone, the no observed adverse effect level (NOAEL) in the 2-year feeding study which was used to calculate the reference dose (RfD) milligrams/kilogram/day (0.043 mg/kg/day) is already lower than the NOAELs from the reproductive and developmental studies by a factor of more than 10-fold. Therefore, it can be concluded that no additional uncertainty factors are warranted and that the RfD at 0.043 mg/kg/day is appropriate for assessing aggregate risk to infants and children as well as adults.

Using the conservative exposure assumptions described above, FMC has concluded that the percent of the RfD

that will be utilized by aggregate exposure to residues of clomazone in/on mint (spearmint tops and peppermint tops) for non-nursing infants (<1 year old), the population subgroup most sensitive, is negligible (i.e., 0.00) and the percent of the RfD that will be utilized by the children (1–6 years old) population subgroup is also negligible (0.00). The percent of the RfD utilized for infants and children for mint (spearmint tops and peppermint tops), plus all other current clomazone tolerances is 0.8 and 0.5 respectively.

Based on the above information, FMC has concluded that there is a reasonable certainty that no harm will result to infants, children or adults from dietary food consumption exposure to clomazone residues from mint (spearmint tops and peppermint tops) plus all other clomazone treated human dietary food sources.

F. International Tolerances

There are codex residue limits for residues of clomazone in or on oilseed rape, potatoes, tobacco, soybeans, rice, cottonseed, sugarcane and peas.
