

six WD40 repeats, and a heparin-binding domain. *In vitro*, over expression of AAMP-1 promotes tumor cell invasion and metastasis as well as angiogenesis. AAMP-1 was later found to be over expressed in endothelial cells, cytotrophoblasts, and poorly differentiated colon adenocarcinoma cells found in lymphatics. In addition, gene expression studies have shown that AAMP-1 is over expressed in breast and gastrointestinal tumors.

The issued patents claim proteins, polypeptides, and recombinant polyclonal antibodies specific to AAMP-1 and their use in diagnostic and therapeutic applications. The antibodies are specific and can detect formalin-fixed antigen and SDS-denatured antigen.

These antibodies can be used for detailed expression studies of AAMP-1 in different cancer cell lines. The antibodies could also be used to promote cell adhesion to a substrate, promote tissue acceptance of prostheses, and promote wound healing. The antibodies could also be used to detect AAMP-1 in patient's sera as a useful diagnostic marker for multiple carcinomas including high nuclear grade ductal carcinoma *in situ* (Clinical Cancer Research Dec 2002 8:3788-95).

Dated: January 31, 2005.

Steven M. Ferguson,

Director, Division of Technology Development and Transfer, Office of Technology Transfer, National Institutes of Health.
