

use. Operators should maintain training in SCBAs.

(4) Procedural controls to maintain a low leakage boundary, such as preventive maintenance/routine inspection of door seals and dampers should be implemented.

(5) Procedures should be developed to ensure control room purging is considered when the outside concentration is less than the inside concentration.

(6) Existing emergency filtration systems should be maintained to practical performance criteria.

The petitioner also states that current TS for system performance would be eliminated and that the administrative portion of the TS could include a requirement to have a Control Room Habitability Program. The petitioner believes that because of the low public risk significance of being outside design guidelines in a Control Room Habitability Program, a plant shutdown would not be required if it is outside of the guidelines. Rather, the petitioner believes that the program could specify that timely actions should be taken to return the plant within the guidelines. If not complete within 30 days, the petitioner suggests that a special report would be sent to the NRC with a justification for continued operation and a proposed schedule for meeting the guidelines.

The petitioner states that removing the specific dose criteria would not eliminate the need to perform quantitative analyses as required to demonstrate the acceptability for certain conditions. The petitioner also states that although the current regulation has no specific quantitative limits for toxic gases, the guidelines require quantitative analyses for toxic gas habitability assessments under certain conditions. The petitioner suggests that as an alternative to total removal of dose guidelines from the regulations, most of his concerns could be resolved if the dose criteria were based solely on the whole body dose from noble gases that he believes is the only possible dose impact that may result in control room evacuation. The petitioner suggests, as another option, that most of his concerns would be resolved if credit for SCBAs and/or KI was allowed in the analysis of the dose from iodine and particulates. The petitioner also proposes that the TS be revised to eliminate shutdown requirements for failure to meet control room habitability requirements.
