

air bubble and appearance test, except that the tested sample * * * began to form crystals. It bears note that the bubble travel time on this sample was 2.7 seconds against the standard's requirement of 35 seconds maximum. Further, the appearance of the sample after testing at minus 50° C was the same as before the testing.

Given the formation of crystals * * *, Equistar asked Case to perform further analysis on the tested retained sample to determine the temperature at which the crystals began to form. The * * * Case report on the crystals * * * indicates that these crystals, which were determined to be small in both size and number, formed at minus 49.9° C, which is within the temperature allowed by the relevant standard—plus or minus 2 degrees relative to minus 50° C. Thus, the results of this Case test on the retained sample do not constitute a failure of the required test in Equistar's view.

Equistar's petition, including the test data it submitted as attachments to its petition, can be found in the NHTSA docket.

Equistar states that "the crystals and globules" in the brake fluid "would not pose a threat to the operation of the brake fluid." Equistar also asserts that the results may be due to "testing laboratories that calibrate their testing equipment in slightly different ways * * *" Equistar refers to two prior NHTSA grants of inconsequential noncompliance petitions which Equistar states involve "virtually identical circumstances involving brake fluid * * *" These are Dow Corning Corporation (59 FR 52582, October 18, 1994) and First Brands Corporation (59 FR 62776, December 6, 1994).

Interested persons are invited to submit written data, views, and arguments on the petition described above. Comments must refer to the docket and notice number cited at the beginning of this notice and be submitted by any of the following methods.
