

through the interlining substrate or strike through the fabric to which it is fused and whose adhesion level will be maintained or improved through garment processing temperatures of up to 350 degrees Fahrenheit and dwell times of 20 minute durations.

- e) The duration and efficacy of the bond will be such that the adhesive will not, during industrial washing, later garment wear or after-care of 30 home washes, become detached from the fabric or base substrate.

The finished interlining fabric is a fabric that has been coated with an adhesive coating after going through a finishing process to remove all shrinkage from the product and impart a stretch to the fabric. This finishing process of imparting stretch to fabric is patented, U.S. Patent 5,987,721.

On February 2, 2004, CITA solicited public comments regarding this request, particularly with respect to whether these fabrics can be supplied by the domestic industry in commercial quantities in a timely manner. On February 18, 2004, CITA and the Office of the U.S. Trade Representative offered to hold consultations with the relevant Congressional committees. We also requested the advice of the U.S. International Trade Commission and the relevant Industry Sector Advisory Committees.

CITA has determined that the domestic industry can supply a product substitutable for the three fabrics described above in commercial quantities in a timely manner. On the basis of currently available information, including review of the request, public comment and advice received, and its understanding of the industry, CITA has determined that there is domestic capacity to supply a substitutable product in commercial quantities in a timely manner. Levi Strauss and Co.'s request is denied.
