support the allowable daily intake for ivermectin residues in food from treated animals. No evidence of toxicity was observed in neonatal rhesus monkeys after 14 days of repeated administration of 0.1 mg/kg/day highest dose tested in juvenile rhesus monkeys after repeated administration of 1.0 mg/kg/day, highest dose tested. The comparative data on abamectin and ivermectin in primates also clearly demonstrate the dose response for exposure to either compound is much less steep than that seen in the neonatal rat. Single doses as high as 24 mg/kg of either abamectin or ivermectin in rhesus monkeys did not result in mortality; however, this dose was more than two times the LD₅₀ in the adult rat and more than 20 times the LD₅₀ in the neonatal rat. The absence of steep dose response curve in primates provides a further margin of safety regarding the probability of toxicity occurring in infants or children exposed to avermectin compounds. The significant human clinical experience and widespread animal drug uses of ivermectin without systemically toxic, developmental, or postnatal effects supports the safety of abamectin to infants and children.

F. International Tolerances

Codex has established an abamectin Maximum Residue Level of 0.02 ppm for peppers. The fruiting vegetable tolerance of 0.02 ppm for abamectin is harmonized with Codex.
