

or developmental effects have been observed.

2. *Infants and children.* In assessing the potential for additional sensitivity of infants and children to residues of hexythiazox, EPA considered data from developmental toxicity studies in the rat and rabbit, and a 2-generation study in the rat. The developmental toxicity studies are designed to evaluate adverse effects on the developing organism resulting from pesticide exposure during prenatal development to 1 or both parents. Reproduction studies provide information relating to effects from exposure to the pesticide on the reproductive capability of mating animals and data on systemic toxicity.

No developmental or reproductive effects have been observed in any study with hexythiazox. The lowest acute NOAEL was 2,400 ppm in the diet (200 mg/kg/day), HDT, in the 2-generation rat reproduction study. In the rat developmental study, the maternal and fetotoxic NOAEL was 240 mg/kg/day and the developmental NOAEL was 2,160 mg/kg/day, HDT. In the rabbit developmental study, the maternal and developmental NOAEL was 1,080 mg/kg/day, HDT.

Taking into account current toxicological data requirements, the data base for hexythiazox relative to prenatal and postnatal effects is complete. In the rat developmental study, the NOAELs for maternal toxicity and fetotoxicity were the same, which suggests that there is no special prenatal sensitivity in the absence of maternal toxicity. Furthermore, the lowest developmental or reproductive NOAEL is 2 orders of magnitude higher than the chronic NOAEL on which the RfD is based. It is concluded that there is a reasonable certainty of no harm to infants and children from aggregate exposure to hexythiazox residues.

F. International Tolerances

Codex MRLs for 12 commodities, not including mint, have been established. A MRL for blackberries at 0.2 ppm has been established in the Netherlands. There are no Canadian or Mexican MRLs for hexythiazox.
