

38,585 banked vintage 2021–2023 allowances will be held in facility or general accounts (84,378 current allowance holdings + 3,365 upcoming NUSA allocations – 49,158 reported 2023 ozone season emissions = 38,585 estimated remaining allowances). Based on these figures, EPA expects that allowance bank recalibration will take place for the 2024 control period and estimates that the amount of banked vintage 2021–2023 allowances that will be held in each facility or general account after recalibration will be the amount of such banked allowances held in the account immediately before recalibration multiplied by 12,605 and divided by 38,585 (or, equivalently, the amount of such banked allowances held in the account immediately before recalibration multiplied by approximately 33%). In the actual allowance bank recalibration process, instead of using the estimated figures described in this notice, EPA will use the most current information available as of the recalibration date.
