This technology pertains to the identification of a novel gene in the ABC (ATP-binding cassette transporter) gene superfamily, the ABCA8 gene. The ABC proteins are involved in extra- and intracellular membrane transport of various substrates such as ions, amino acids, peptides, sugars, vitamins, or steroid hormones. At least 14 members of the ABC gene superfamily have been described as associated with human disease.

The ABCA8 gene is one of a group of several ABCA genes that is organized in a single large cluster on chromosome 17q24, in a head to tail fashion, and conserved in the mouse genome. The ABCA8 gene is believed to be involved in the reverse transport of cholesterol, as well as in the membrane transport of other lipophilic molecules such as inflammation mediating substances such as prostaglandins and prostacyclins.

The above-mentioned invention is available for licensing on an exclusive or non-exclusive basis.
