

Guidance for Fiscal Year 1997 and Future Years (May 1996), modified slightly to apply to Tribal programs rather than State programs. The entire guidance may be viewed at www.epa.gov/owow/nps/guide.html.

Elements of a Well-Designed Watershed Implementation Plan

A well-designed plan for a successful watershed implementation project typically includes the following:

1. Define the Problem

- *Identification of water quality threat or problem*—Information is provided on whether the water resource is threatened or its use is impaired from the Tribe's nonpoint source assessment report, 303(d) list, or other Tribal water quality assessment reports.
- *Critical areas*—The approximate size and location of the critical areas to be treated is identified on a map and quantified. The critical areas are of an appropriate size to ensure that the measures implemented will have a significant impact on restoring or protecting designated beneficial uses within the watershed.

2. Build a Project Team and Public Support

- *Institutional roles and responsibilities*—Roles and responsibilities of agencies and organizations active within the watershed are identified, regardless of funding source. All Tribal, Federal, and State agencies and other organizations that have potential roles to play in assisting in the design and implementation of the project are identified and included as appropriate in the project development and implementation process. Where possible, one agency at the local level is identified as the lead agency for the watershed project.
- *Information/education and public participation component*—The nonpoint source watershed plan documents how interested and affected public are or will be involved in the selection, design and implementation of the watershed project. Additionally, the educational activities to be conducted in the watershed project are identified, including a schedule. The project also includes a plan for communicating lessons learned to other areas of the Tribe through the Tribe's nonpoint source information and education program.

3. Set Goals and Identify Solutions

- *Nonpoint source control objectives*—The nonpoint source watershed plan describes what is expected to be accomplished in a two to five year period. Objectives relate to all the identified water quality problems, are quantitative, and make progress towards achieving implementation of technology-based measures or achieving Tribal water quality goals. For example, where water goals are not met and a 75 percent reduction of a particular pollutant is needed to achieve them, an objective might be to reduce the pollutant loadings to the waterbody by 75 percent.

4. Implement Controls

- *Implementation schedule*—A schedule describing the location and type of BMPs and programs to be implemented within the watershed and the projected time of

implementation are provided within the plan. The plan also includes an estimate of the costs of the planned activities.

5. Measure Success

- *Monitoring and evaluation*—Utilizing the project goals identified in the work plan, the plan should also provide an appropriate monitoring component to evaluate effectiveness, including ambient effects monitoring, beneficial use assessments, and environmental indicators (see Section II-A and Appendix B of the May 1996 nonpoint source guidance).
