Much work has focused on understanding and utilizing nucleic acids as biological catalysts. Indeed, progress has been made in determining the mechanism, kinetics and conformational requirements in harnessing these potential biological catalysts. This technology has value in its potential for gene therapy applications such as gene silencing.

The technology described is a recombinant plasmid or expression vector in which a DNA-encoded trans-acting hairpin ribozyme of interest is ligated to DNA-encoded cis-acting hairpin ribozyme. In this configuration, the cis-acting ribozyme serves to cleave the 5' and 3' ends of the trans-acting ribozyme of interest. The trans-acting ribozymes can be replaced with any user-defined sequence such as antisense RNA or RNAs of viruses. This unit provides several trans-acting hairpin ribozymes that are trimmed at the ends are further generated. Thus several independent ribozymes can be produced from a single transcribed RNA.
