SUPPLEMENTARY INFORMATION:

I. Abstract

This request is for a new information collection.

The goal of this project is to select a short (8-10) list of ecosystem indicators for the Gulf of Alaska that will form the

basis of a Gulf of Alaska (GOA) Report Card and Ecosystem Assessment to include in the NOAA's Ecosystem Considerations report. This report is produced annually as part of the Stock Assessment and Fishery Evaluation report for the North Pacific Fishery Management Council. The format of the new GOA Report Card and Ecosystem Assessment will be similar to those that have been produced in recent years for the eastern Bering Sea and Aleutian Islands.

The primary recipients, considered to be the stakeholders, of the Report Card and Ecosystem Assessment are those involved with the fishery quota-setting process for the North Pacific Fisheries Management Council. This includes the Science and Statistical Committee and the regional Plan Teams, which of are composed of mainly federal and state scientists, academics, and other individuals. Additional recipients include the Advisory Panel, Council, and stock assessment scientists. The Report Card and Ecosystem Assessment are also made available to the public.

For the purposes of this project, ecosystem indicators are defined as time-series of data that measure some component of the ecosystem. Hundreds of indicators are available for the GOA, which is defined as the Canadian-US boundary at Dixon Entrance to the east and False Pass to the west. During a workshop in 2010, a group of largely scientists and some fisheries managers with expertise in the eastern Bering Sea ecosystem selected 10 indicators to best represent trends in productivity in the eastern Bering Sea. In 2011, a more diverse group including a commercial fisherman and conservation non-governmental organization representative met in a similar workshop format to select 8 ecosystem indicators for the Aleutian Islands that best characterized trends in variability throughout the ecosystem. For the GOA, we hope to increase the group size and diversity in GOA expertise of the participants in the indicator selection process by soliciting information individually via an online survey. The main objective of the survey is to have participants rank the importance of ecosystem indicators among lists of indicators that are presented; the surveys will then be compiled to generate a list of top indicators. We have developed a non-exhaustive list of about 75 ecosystem indicators that are grouped by categories based on ecosystem components, such as forage fish or seabirds. Participants will be asked to select the top three within each category, then the top ten among all categories. Space is provided for

suggestions of additional indicators not included. We will use these rankings to form the basis of a new GOA report card and ecosystem assessment. We hope that by surveying a greater number of individuals than were involved with indicator selection for the eastern Bering Sea and Aleutian Islands, the survey results will reflect broader expertise and an 'equal voice' from all participants.

The GOA is characterized by topographical complexity, including: Islands; deep sea mounts; continental shelf interrupted by large gullies; and varied and massive coastline features such as the Cook Inlet, Prince William Sound, Copper River, and Cross Sound, which bring both freshwater and nutrients into the GOA. The topographical complexity leads to ecological complexity, such that species richness and diversity differ from the western to eastern GOA. Thus, local effects of ecosystem drivers may swamp basin-wide signals. With this in mind, we hope to create a short list of ecosystem indicators that best reflect the complexity of the GOA.

II. Method of Collection

Respondents will be asked to fill out an online survey.
