

using the imaging agent in the detection of metastatic disease in the liver is also within the scope of the invention.

E-338-2003—Method for Imaging the Lymphatic Systems Using Dendrimer-Based Contrast Agents

The invention is a 4D method of Magnetic Resonance lymphography using a 240kD contrast agent based on generation-6 polyamidoamine dendrimer (G6). The use of the G6 contrast agent greatly enhances visualization of lymphatics and node drainage associated with mammary tumors and further aids in the diagnosis of metastatic breast cancer. After direct injection of the G6 contrast agent into

mice, lymphatics and nodes were visualized in both spontaneous (HER2 transgenic mouse) and xenografted (PT-18) breast tumors to metastatic lymph nodes. The conventional clinically approved MRI contrast agent, Gd-[DTPA]-dimeglumine (<1kD) was unable (in murine models) to depict lymphatics when used in conjunction with the same imaging system. The invention provides a novel method of using a known contrast agent to visualize lymphatic drainage that has not been previously reported.

E-317-2004—Synthetic Metal Ion Chelating Amino Acid Suitable for Use in Solid Phase Peptide Synthesis

The invention is metal chelators, metal chelator-targeting moiety complexes, metal chelator-targeting moiety-metal conjugates, kits, and methods of preparing them. These chelators are useful in diagnosing and/or treatment of cancer and thrombosis. The metal chelators may be used in conventional synthetic methods to form targeting moieties (e.g., peptides, proteins, and Starburst polyamidoamine dendrimers (PAMAM), capable of conjugating diagnostic and/or therapeutic metals. The formulae for two such chelators is shown below:
