

with prostate cancer each year and the disease accounts for nearly one quarter of all new cancer diagnoses of all new male cancer diagnoses. Worldwide, about 395,000 men are diagnosed with prostate cancer each year and the incidence is on the increase. The total direct medical cost of prostate cancer in the U.S. is \$ 5 billion per year. It is estimated that prostate cancer therapeutics in the U.S., Europe and Japan will cost \$ 7.3 billion in 2011.

The global annual cancer market is estimated at \$35 billion with breast, lung and prostate cancers being the most significant contributors. Incidences of lung, breast and stomach cancers were found to be 351,344, 220,000, and 25,000 respectively in the U.S. The current market size of drugs used for the treatment of lung cancer is \$ 25 billion, while that of breast cancer is \$3.3 billion.

Current Competitive Product(s)

Currently there are no genetic markers available to assess the responsiveness of an AIPC-patient to therapy before starting the treatment. Knowing CYP1B1*3 genetic status saves time and money of patients and prevents ineffective treatments.

Value Proposition

The FDA approved dose and schedule for docetaxel in combination with prednisone in the treatment of androgen-independent (hormone-refractory) metastatic prostate cancer is 75 mg/m² IV infusion for 1 hour every 3 weeks with 5 mg prednisone continuously and average cost per cycle of therapy is \$ 4,298. The use of docetaxel has been recently shown to prolong survival and improve rates of response and quality of life, but it is unclear which patient would benefit from treatment with this drug given that high variability in clinical response has been observed. A consequence of such variability is that a docetaxel treatment may be effective in one subject and ineffective or poorly tolerated in another subject. Thus, administration of such a drug to a subject in whom the drug would be ineffective would result in wasted cost and time during which the patient's condition may significantly worsen. Also, administration of a drug to subject in whom the drug would not be tolerated could result in a direct worsening of the patient's condition and could even result in death. This technology identifies the polymorphism of CYP1B1*3 gene which modulates the therapeutic response to docetaxel treatment. This genetic marker can be measured in DNA obtained from a blood sample to predict overall survival in

patients with prostate cancer prior to treatment with docetaxel. Genetic markers with predictive power to assess inter-subject differences resulting in clinical outcome prior to docetaxel administration have profound clinical importance.
