

(c) Permissible drags are not commercially available and permissible locomotives are not commercially available, partly due to their small size.

(d) Because of low daily production rates and full timbering support, in-rushes of methane resulting from pillar falls are unlikely to occur.

(e) Recovery of the pillars above the first miner heading is usually accomplished on the advance within 150 feet of the section intake (gangway) and the remaining minable pillars are recovered from the deepest point of penetration outby.

The petitioner proposes the following alternative method:

(a) The equipment shall be operated in the working section's only intake entry (gangway) which is regularly traveled and examined.

(b) Methane testing shall occur on an hourly basis and the test results shall be recorded in the on-shift examination record.

(c) Equipment operation shall be suspended if the methane concentration at the equipment reaches 0.5 percent methane when found during a pre-shift examination or during operation.

(d) The required intake air flow of 5,000 cubic feet per minute shall be measured just outby the non-permissible equipment, with the ventilating air passing over the equipment to ventilate the pillar being mined.

(e) The electrical equipment shall be monitored during operation and shall be de-energized at the intersection of the working gangway and intake slope.

(f) Where more than one active line of pillar breast recovery exists, the locomotive may travel to a point just outby the deepest active chute/breast (room) workings or last open crosscut in developing set of entries.

The petitioner asserts that the alternate method proposed will at all times guarantee no less than the same measure of protection afforded the miners under the mandatory standard.

Director, Office of Standards, Regulations, and Variances.

SUPPLEMENTARY INFORMATION:

I. Abstract

This information collection enabled NASA to pre-test methods to collect information from individuals to determine community response to the new, quieter sonic booms, prior to the start of flight testing the X-plane. No public exposure to any form of sonic boom occurred during the pre-testing phase.

The pre-test was conducted by telephone interview. NASA wanted to evaluate telephone surveys to assess prompt public response associated with experiencing low amplitude sonic booms over multiple, geographically dispersed communities. Responses were voluntary.

The new X-plane is designed to produce low amplitude sonic booms. Ultimately, flight testing of the X-plane is intended to (1) demonstrate and validate the technology necessary for civil supersonic flights that create low

amplitude sonic booms, and (2) assess community response to the new, quieter, sonic booms.

II. Methods of Collection

Telephone.
