

head and ear anatomy are produced from whole carcasses, heads, or temporal bones from animals that strand and die or die in captivity. The tissues are scanned by CT (Computerized Tomography) and MRI (Magnetic Resonance Imaging) and the ears are decalcified, sectioned, digitized, and reconstructed. Measurements from these reconstructions are used to calculate frequency distribution maps for each species examined. These inner ear models have provided the first evidence of acute infrasonic hearing in some species, new insights into how marine mammals achieve extreme infra and also ultrasonic hearing, and estimates of species specific hearing curves. A permit is requested for a period of 5 years.

In compliance with the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*), an initial determination has been made that the activities proposed are categorically excluded from the requirement to prepare an environmental assessment or environmental impact statement.

Concurrent with the publication of this notice in the **Federal Register**, NMFS is forwarding copies of this application to the Marine Mammal Commission and its Committee of Scientific Advisors.
