SUPPLEMENTARY INFORMATION:

Background

Arundo donax is a highly invasive, bamboo-like weed that was introduced to North America in the early 1500s for its fiber uses. It is among the fastest growing plants in the continental United States, making it a severe threat to riparian areas, where it causes erosion, damages bridges, alters channel morphology, increases costs for chemical and mechanical control along transportation corridors, and impedes law enforcement activities along international borders. Additionally, *A. donax* consumes excessive amounts of water, competing for water resources in arid regions where these resources are critical to the environment, agriculture, and municipal users.

The proposed biological control agent, *Tetramesa romana*, is a wasp in the insect family Eurytomidae. It has a widespread presence around the Mediterranean basin, from Turkey to Spain and Morocco, and was also found
