

MyoD, which is an inhibitor of the CDK4. CDK4 is one of a number of cyclin-dependent kinases which control progression through the cell cycle through their ability to phosphorylate particular substrates at the correct phase of the cell cycle. CDK4 has been shown to be involved in cell cycle control through its ability to regulate the activity of the retinoblastoma protein, pRb, an activator of genes essential for cell division.

Inhibitors of the cyclin-dependent kinases, such as the peptides described in this invention, prevent cell cycle progression and induce cells to exit the cell cycle into the Go state. The peptides described in this invention prevent the phosphorylation of pRb by CDK4, an obligate step for entry into the cell cycle. Osteosarcomas and habdosarcomas are two types of tumors known to over-express pRb. The inhibitor described in this invention may be useful in treating these cancers or other diseases which have been specifically linked to over-expression of active pRb.

#### *Applications*

Method to treat proliferative disorders, including cancer.

Anti-proliferative therapeutics.

Research tool to study the cell cycle.

*Advantages:* Expression of this peptide either as a fusion protein with GST or GFP results in the cessation of cell growth.

#### *Market*

An estimated 1,444,920 new cancer diagnoses in the U.S. in 2007.

600,000 deaths caused by cancer in the U.S. in 2006.

Cancer is the second leading cause of death in the United States.

It is estimated that market for cancer drugs would double to \$50 billion a year in 2010 from \$25 billion in 2006.
